Forensic Analysis of the SOSANA, SHIFT AI, and CRM Decentralized Finance Criminal Enterprise

Executive Summary of the Investigation

The landscape of decentralized finance (DeFi) and cryptocurrency investment has undergone a profound transformation throughout 2025 and into early 2026. As documented by leading cybersecurity and digital defense analyses, the threat ecosystem has moved away from isolated, opportunistic exploitation events toward industrialized, persistent, and highly organized criminal enterprises.[1] This evolution is characterized by an "agentic shift," wherein artificial intelligence and sophisticated automation are deployed not merely to assist malicious actors, but to autonomously execute complex, multi-stage financial extractions across decentralized networks.[3] The investigation into the interconnected operations surrounding the SOSANA entity, the SHIFT AI project, and the CRM token ecosystem reveals a masterclass in this new paradigm of industrialized fraud.

Operating continuously from April 2025 through March 2026, this criminal architecture executed a series of coordinated market manipulations, liquidity extractions, psychological operations, and witness intimidation tactics.[4] The enterprise has successfully extracted a confirmed minimum of $886,597 in illicit profits, with forensic tracing suggesting the total network capitalization exceeds $4,000,000, and marketing claims hinting at a broader $15 million extraction across its operational history.[4]

This exhaustive report provides a definitive forensic reconstruction of the network's topology. The analysis reveals a highly compartmentalized, seven-tier organizational structure utilizing at least 74 dedicated infrastructure wallets, an automated 970-wallet botnet, and a senior treasury controlling tens of thousands of Solana (SOL).[4] The operational methodology demonstrates military-grade operational security (OPSEC). The syndicate utilized zero-cost asset acquisitions, 1-lamport dust transfers for network seeding and investigator harassment, shared smart contract execution environments, and the deployment of proprietary tokens—specifically Purple BTC (PBTC)—as an internal laundering and syndicate compensation mechanism.[4]

The forensic evidence establishes that the network's actions constitute a continuing criminal enterprise, unequivocally satisfying the predicate requirements for Racketeer Influenced and Corrupt Organizations (RICO) Act prosecution under 18 U.S.C. § 1962.[4] The enterprise actively engages in wire fraud, securities fraud, money laundering, and obstruction of justice through the deliberate deletion of on-chain data structures.[4] By analyzing the immutable transaction graphs, contract deployments, and synchronized execution timestamps, this report dismantles

the illusion of decentralized community governance that the syndicate utilized to mask its industrialized extraction infrastructure, providing a comprehensive blueprint for federal law enforcement intervention.

The Macro Environment: Industrialization of Decentralized Fraud

To understand the mechanics of the SOSANA enterprise, it is necessary to contextualize the broader threat landscape of 2025 and 2026. The proliferation of artificial intelligence has significantly lowered the barrier to entry for sophisticated cybercrime, while simultaneously amplifying the capabilities of established syndicates.[1] Reports from the cybersecurity sector indicate that attack costs are collapsing, with the median exploitation cost dropping significantly between model generations, allowing threat actors to generate exponential operational scale for the same compute budget.[6]

This "industrialization of fraud" has resulted in criminal organizations operating complex business models where different sub-groups specialize in distinct parts of the fraud supply chain, ranging from developer groups supplying phishing software to administrative groups running collaboration forums.[2] In the cryptocurrency sector, this manifests as highly coordinated networks capable of deploying hundreds of wallets simultaneously, executing parallel transactions to manipulate market liquidity, and utilizing automated bots to extract retail capital at speeds impossible for human traders.[2] The SOSANA syndicate perfectly embodies this industrialization, moving beyond simple rug-pulls to establish a persistent, multi-project extraction engine.

The Genesis Operation: SHIFT AI and the Fabrication of Governance

The sophisticated infiltration of the CRM token ecosystem in late 2025 and early 2026 was not an isolated event. It was the culmination of methodologies perfected during the syndicate's pilot operation: the SHIFT AI project. Marketed in early 2025 as a decentralized artificial intelligence platform governed by community voting, SHIFT AI served as the foundational template for the enterprise's subsequent extraction protocols.[4]

The narrative of community-driven contest selection, designed to manufacture retail investor confidence, was entirely fabricated. Forensic analysis of the blockchain timeline indicates that the purportedly democratic "voting" process executed during the April 2025 SHIFT contest possessed absolutely zero corresponding on-chain infrastructure during its operational window.[4] The smart contract allegedly responsible for tallying these votes (address 2MJ2w...4tgq) was not deployed until December 2025—a full eight months after the conclusion of the contest it supposedly governed.[4] This temporal impossibility irrefutably proves that the contest winners were pre-selected through a centralized, operator-controlled database,

completely bypassing the decentralized governance mechanisms advertised to the public.[4]

The execution of the SHIFT AI liquidity extraction demonstrates precise, automated coordination that belies any claims of organic market movement. The operation relied on profound insider knowledge and synchronized execution logic.

Transaction Timestamp	Wallet Identifier	Action Executed	Forensic Significance
April 21, 2025, 00:13:00 UTC	AvZHExxq2BaPrq17cKq1KMN3PWoCwqZRppV882JHY5sN	Acquired 2.29 million SHIFT tokens	Executed exactly 13 minutes prior to the public project announcement.
April 21, 2025, 00:16:05 UTC	F1eSPc1xhWikUiGv4jSUcXE7Vbm5iLwSK5dvzATXGi5p	Acquired massive token position	Executed at the exact second of the public announcement.
April 21, 2025, 00:16:05 UTC	7ACsEkYSvVyCE5AuYC6hP1bNs4SpgCDwsfm3UdnyPERk	Acquired massive token position	Executed synchronously with F1eSPc1, utilizing Binance 8 funding.

Following the artificial inflation of the token's value, driven by retail participants reacting to the fabricated community governance narrative and the deployment of AI-centric marketing buzzwords [7], the syndicate initiated the extraction phase. Between April 21 and April 25, 2025, a parent wallet designated 7GsFEUPCNe53Pt6Ytf2df6Hg4WByjDQpRJshuxAs6p3 executed 17 systematic sell orders.[4] Simultaneously, an automated trading bot operating under the address CkUZV387xnoGpF7wC2moMa6mPmAgCvTT4pWgzq4M9fCD executed high-frequency liquidation transactions at precise 6-second intervals.[4] This algorithmic distribution of assets maximized the extraction of underlying liquidity while preventing immediate panic selling among retail holders. Furthermore, a parallel child wallet, 8Jw48ELRycmWZpDZ3WrTjgCbmz5u1vSK65a8kJvKKq2M, was utilized to disperse the sell pressure, ultimately yielding over $740,000 in illicit profits for the enterprise.[4]

The Purple BTC (PBTC) Laundering and Syndicate

Incentive Apparatus

A critical vulnerability for any decentralized criminal syndicate lies in the compensation of its field operatives and insider nodes. Traditional distributions of base-layer assets (such as SOL or ETH) or highly liquid stablecoins (USDC/USDT) generate easily traceable monetary flows that can be rapidly analyzed by law enforcement and blockchain investigators.[2] To circumvent this forensic vulnerability, the SOSANA enterprise utilized a specialized, tightly controlled cryptographic asset—Purple BTC (PBTC)—as an internal settlement layer, laundering mechanism, and operative loyalty credential.[4]

The PBTC asset, historically associated with the pNetwork as a wrapped Bitcoin protocol, has a documented history of severe vulnerabilities, most notably a 2021 cross-chain exploitation event that resulted in the theft of 277 pBTC, valued at over $12 million at the time.[10] The SOSANA syndicate leveraged this specific token ecosystem, centralizing its control to facilitate internal transfers without relying on primary decentralized exchanges. The forensic graph identifies a central treasury wallet, DojAziGhpLddzSPTCsCvp577wkP9N6AtVc87HJqihcZd, which unilaterally controls 90.97% of the total PBTC supply.[4]

On June 8, 2025, acting as the profit coordinator for the SHIFT AI extraction, the DojAziGhp treasury disbursed PBTC payments to the designated "winners" of the fraudulent April contest.[4] The scale of these disbursements and their subsequent retention proves the ongoing complicity of the recipient wallets within the criminal enterprise, transforming them from alleged contest participants into confirmed syndicate operatives.

Insider Wallet Identifier	**Initial PBTC Payout (June 8, 2025)**	**Retained Holdings (March 2026)**	**Asset Multiplier**
F1eSPc1xhWikUiGv4jSUcXE7Vbm5iLwSK5dvzATXGi5p	38.11 PBTC	25,563 PBTC	~670x
7ACsEkYSvVyCE5AuYC6hP1bNs4SpgCDwsfm3UdnyPERk	40.76 PBTC	25,722 PBTC	~631x

Rather than immediately liquidating these assets, these nodes retained them as the syndicate artificially inflated the token's perceived value over the subsequent months.[4] The retention of over 51,000 PBTC by these entities definitively classifies them as active, compensated

members of the syndicate's infrastructure, utilizing PBTC as a form of restricted equity or deferred compensation.[4]

Crucially, the PBTC treasury serves as the primary financial bridge connecting the historical SHIFT AI fraud to the subsequent CRM token sabotage. The central CRM operational router, 8eVZa7bEBnd6MA6JJkNdABRN4S3LbVLRnCZNJAUeuwQj, was identified holding 116,600 PBTC (acquired in November 2025), valued at approximately $7,770.[4] The movement of value from the DojAziGhp ecosystem through decentralized exchange aggregators (such as the Raydium liquidity pool 5Q544fKrFoe6tsEbD7S8EmxGTJYAKtTVhAW5Q5pge4j1) to the 8eVZa7b node establishes an unbroken chain of capital funding the multi-project enterprise.[4]

The CRM Ecosystem Infiltration: A Study in Algorithmic Sabotage

Following the successful extraction of capital from SHIFT AI and the subsequent laundering phase via PBTC, the syndicate pivoted its infrastructure toward a new target: the CRM token. The methodology evolved significantly from the rapid pump-and-dump mechanics of the SHIFT operation into a highly sophisticated, multi-phase infiltration. This new strategy was designed to seize total supply control, suppress asset birth prices, and systematically bleed liquidity from the ecosystem without triggering immediate countermeasures from the legitimate developers or the community.[4]

Phase 1: Birth Suppression and Market Pre-Positioning

The attack against the CRM token commenced precisely at the asset's launch phase, a period of maximum vulnerability for decentralized protocols. On December 8, 2025, a Tier 5 operative wallet (BKLBtcJQJ2MxJP6wfbRkoqrYNWUPVLfeB8vs91agBxjt) executed a single, catastrophic liquidation of 41,000,000 CRM tokens.[4] Representing 4.1% of the total token supply, this transaction was designed to inflict profound psychological and financial damage on the asset's early market structure.[4]

By crushing the initial price discovery mechanism through this massive dumping event, the syndicate created an environment of artificially depressed valuation. This market manipulation allowed their subsequent infrastructure nodes to accumulate and move significant percentages of the total supply with minimal capital outlay.[4] Following this orchestrated "birth suppression," the BKLBtcJQ wallet retained a balance of 5.77 million CRM, maintaining its active position within the core cluster for future operational phases.[4]

Phase 2: The Zero-Cost Loading and Obfuscated Distribution

With the asset price artificially suppressed, the enterprise initiated its primary distribution and loading phase between December 28 and December 31, 2025.[4] The operation relied upon a Tier 4 "Feeder" wallet, HLnpSz9h2S4hiLQ4uN3vGYAHJqDmbFCwkx9prSXkdPMc, which held an astonishing 81,451,516 CRM (8.15% of the total supply).[4] Forensic analysis reveals that this

massive position was acquired entirely at a $0 cost basis.[4] This zero-cost acquisition points heavily toward the exploitation of insider allocations, pre-mining vulnerabilities, or the subversion of the initial token generation event by the syndicate operators.[4]

To avoid the detection algorithms of block explorers, decentralized exchange monitors, and anti-money laundering (AML) compliance tools, the HLnpSz9h Feeder did not transfer its payload in a single, highly visible transaction. Instead, it utilized an obfuscation technique known as "dust transferring." Over the course of the late December window, the Feeder executed more than 30 micro-transactions to seamlessly move 20,000,000 CRM into the Tier 3 CRM Operator node, 8eVZa7bEBnd6MA6JJkNdABRN4S3LbVLRnCZNJAUeuwQj.[4]

On December 31, 2025, the 8eVZa7b operator further obscured the supply chain by distributing a highly strategic allocation of exactly 1,000,000 CRM to a Tier 5 criminal satellite wallet, 7abBmGf4HNu3UXsanJc7WwAPW2PgkEb9hwrFKwCySvyL.[4] By obfuscating the origin of the tokens through an intricate web of satellite routing nodes, wash traders, and dormant holding accounts, the enterprise successfully embedded itself deeply into the CRM ledger. Forensic audits confirm that 13 highly coordinated criminal wallets managed to seize covert control of 305,235,356 CRM tokens—amounting to 30.52% of the entire circulating supply.[4]

Phase 3: The March 26 Coordinated Liquidity Extraction

The operational culmination of the CRM infiltration occurred over a highly compressed 4.5-hour window on March 26, 2026. Leveraging their dominant, zero-cost supply position, the syndicate executed a synchronized extraction protocol designed to systematically strip the remaining liquidity pools of their underlying value while deploying advanced countermeasures to prevent market recovery.[4] The timeline of the assault demonstrates programmatic, non-human execution:

Timestamp (UTC)	Executing Wallet Identifier	Operational Action	CRM Volume Dumped
15:08:21	HLnpSz9h2S4hiLQ4uN3vGYAH... (Feeder)	Initiates the extraction sequence	140,377
15:28:07	7DCqrdtd (Partial identifier)	Sequential secondary dump	92,870
16:34:29	HU23r7Uo (Partial	Sustained liquidity	143,930

	identifier)	pressure	
18:04:31	HGS4DyyX3PiP8WhvsANWwqmB...	High-volume market sell	516,000
19:17:43	GzgjzAToNeZz (Partial identifier)	Cross-asset conversion (to MHGA)	226,863
21:38:45	AFXigaYuRKYmvd9HZQCobtZ9...	Botnet Deployment (138 wallets/sec)	Seeding 970 Wallets
22:37:54	6LXutJvKzuNFGEwh7nzj1o7b...	Coordinated "Twin Finale" execution	645,000
22:37:54	7uCYuvPbHdhc5X8Y6gPhYx8q...	Coordinated "Twin Finale" execution	645,000

The exact synchronization of the final twin dumps is of profound forensic significance. The sale of precisely 645,000 CRM by two separate wallets (6LXutJvK and 7uCYuvPb) at the exact same UNIX timestamp provides irrefutable evidence of algorithmic, centralized command and control.[4] This level of coordination is physically impossible for disparate human traders manually executing swaps through decentralized exchange interfaces. It strongly points to a unified script triggering multiple private keys simultaneously through a localized execution environment.[4]

Simultaneous to the liquidity drain, the syndicate deployed an advanced operational security maneuver. Between 21:38 and 21:42 UTC, while the CRM price was being actively suppressed, the AFXigaYu infrastructure node seeded 970 new wallets.[4] This mass-deployment utilized 17 parallel signers, generating over 1,000 transactions in under four minutes.[4] This action served a dual purpose: expanding the network's capacity for future extraction phases and overwhelming blockchain monitoring tools with sheer transaction volume, effectively acting as a digital smokescreen for the ongoing financial theft. Over the course of the March 26

operation, the network realized a minimum of $11,456 from the direct sale of 2,496,455 CRM tokens, completely bypassing the legitimate development team.[4]

Architectural Topology of the Criminal Enterprise

The investigation into the SOSANA and CRM incidents reveals an organizational structure that mirrors traditional, highly sophisticated organized crime syndicates, meticulously adapted for the cryptographic realities of decentralized networks. The architecture relies heavily on compartmentalization; upper-tier management nodes are strictly insulated from the lower-tier field operative nodes through complex routing bridges, liquidity pools, and batch-funding mechanisms.[4] The network can be classified into six distinct functional tiers.

Tier 0: The Anonymous Root and Funding Origin

At the absolute apex of the network sits the root funder, operating from the address CNSob1LwXvDRmjioxyjm78tDb2S7nzFK6K8t3VmuhKpn.[4] This entity provides the initial capitalization required to fuel gas fees, account rent exemptions, and operational costs for the downstream network. Unlike lower-tier burner wallets, which are discarded post-extraction, this address operates as an active, persistent trader. It avoids direct interactions with centralized exchanges (CEX) that require Know Your Customer (KYC) identity verification, opting instead to self-fund via decentralized, obfuscated token swaps.[4] On January 5, 2026, this root node activated the CRM infiltration by funding intermediate staging wallets (ARu4n5mFdZog and HLnpSz9h), and on March 26, it oversaw the upward extraction of 182 USDC, routing the stablecoins away from the compromised ecosystem.[4]

Tier 1 and 2: Command, Treasuries, and Profit Coordination

The command layer consists of the central treasuries holding the extracted wealth and the sophisticated routing nodes that deploy capital to the execution layers.

- **The Profit Coordinator (A3SbJp6XJdKwcx41A6QFjGWDJqTRVDV4ik6ueU2qtg22):** Acts as the money laundering nexus, receiving stablecoin extractions (such as the 182 USDC transfer originating from Tier 0) for eventual fiat off-ramping across international borders.[4]
- **The SOSANA Protocol Treasuries:** The wallets 9ygyAqzna7rUk7nwfhTA3mqPye9m6uDBahzWQAA59VGx (v1 deployer) and F4HGHWyaCvDkUF88svvCHhSMpR9YzHCYSNmojaKQtRSB (v2 treasury) manage the permanent 3% fee drains maliciously imposed on SOSANA token transfers.[4] As of late March 2026, these vaults held an uncollected, perpetually growing surplus of approximately $135,141 in diverted retail capital.[4]
- **The Senior Payout Treasury (ASTyfSima4LLAdDgoFGkgqoKowG1LZFDr9fAQrg7iaJZ):** Serving as the post-dump paymaster and central bank, this wallet holds immense capital reserves, verified at 33,413 SOL (valued at approximately $4,000,000) alongside hundreds of thousands of PBTC.[4] It

operates as the financial settlement engine for field operatives following successful extraction events.[4]

- **The Infrastructure Root (AFXigaYuRKYmvd9HZQCobtZ98FNAwnwpsnjvJRztUGb6):** Perhaps the most critical technical component of the syndicate, this node acts as the bridge across multiple discrete operations. It managed the insider wallets during the April 2025 SHIFT AI scam and unilaterally deployed the massive 970-wallet botnet infrastructure during the March 2026 CRM attack.[4]

Tier 3: Botnet Operators and Compartmentalized Cells

Below the command layer, the enterprise utilizes highly compartmentalized operational cells, ensuring that the compromise of one sector does not jeopardize the entire network. The forensic audit discovered that the botnet funding mechanics utilized identical programmatic "playbooks" executed by different orchestrator wallets.[4]

Operational Cell	Operator Wallet	Target Asset	Deployment Date	Botnet Scale
Cell 1	EWWme3CV...	BKLBtcJQ...	Dec 25, 2025	19 wallets
Cell 2	5V5tWmXb...	8eVZa7b...	March 2026	20 wallets
Cell 3	A9AgntJYr...	8eVZa7b...	March 2026	18 wallets
Cell 4	9NnFmTi8...	8eVZa7b...	March 2026	17 wallets

This structured deployment mechanism relies heavily on 1-lamport dust funding to activate recipient accounts efficiently. By splitting the operational load across EWWme3CV, 5V5tWmXb, A9AgntJYr, and 9NnFmTi8, the syndicate creates a decentralized facade for a highly centralized operation.[4] This compartmentalization showcases a high degree of professional criminal design, explicitly satisfying the structural requirements of a RICO "association-in-fact" enterprise.[4]

Tiers 4 and 5: Feeders, Satellites, and Field Operatives

The lowest tiers consist of the wallets interacting directly with the victim tokens, smart

contracts, and retail markets.

- **Tier 4 (The Feeders):** Includes wallets like HLnpSz9h, which loads the network with zero-cost assets, acting as the primary pipeline connecting the illicit acquisition to the operational distribution layer.[4]
- **Tier 5 (Satellites and Operatives):** Contains the myriad of satellite wallets (D9ZGRMhmdM, 7abBmGf4H, J3V68JvjX) that break the transaction graph through peer-to-peer lateral transfers.[4] This tier also houses the "Dormant Volcanoes" (like DLHnb1yt holding 104.6 million CRM) and the specific, single-use operative wallets designed to execute the final, devastating market sell orders (e.g., the 6LXutJvK and 7uCYuvPb twin dumpers).[4]

Immutable Forensic Fingerprints and Cross-Operation Bridges

The complexity of decentralized ledgers and the proliferation of anonymization tools often obscure the connections between seemingly isolated financial crimes. However, the immutable nature of blockchain transaction histories allows sophisticated investigators to identify operational fingerprints that irrefutably link temporally distinct events. In the context of the SOSANA enterprise, the identification of cross-operation bridge wallets and shared contract executions elevates the investigation from a localized token fraud to a federal-level continuing criminal enterprise.[4]

The BmZY862D62 Bridge: Proving Continuity

A critical piece of forensic evidence lies in the activities of the wallet BmZY862D62y8vQsdn9mKygYsm8GeBUiozpmGzLp4HmzP. On November 22, 2025, this address received a 0.98 SOL fee payment. This transaction represented the very first inbound funding for the Tier 5 operative wallet BKLBtcJQ—the exact wallet that would go on to execute the devastating 41 million CRM token birth-suppression dump just weeks later on December 8, 2025.[4]

Four months later, during the climax of the CRM infiltration in late March 2026, the identical BmZY862D62 wallet re-emerged from dormancy.[4] Retaining a significant operational float of 51.5 SOL, this wallet executed over 80 parallel seeding transactions on March 25 and an additional 8 parallel transactions on March 26.[4] These transactions were executed in direct support of the AFXigaYu 970-wallet botnet deployment.[4]

The presence of the exact same operational wallet coordinating the genesis attack in November 2025 and the massive scaling operation in March 2026 provides irrefutable proof of operational continuity.[4] It legally negates any defense attempting to classify these events as the disparate actions of independent, opportunistic retail traders, establishing instead the presence of a persistent, centrally managed criminal infrastructure operating across an

extended, multi-month timeline.

The Gp3XVp1V4j Contract Fingerprint

Further cementing the unified nature of the enterprise is the identification of shared smart contract infrastructure. The contract account address Gp3XVp1V4jsnrCHErb7CBQmPNyKG7mH88ziKqCZNaLo3 appears as an instruction processor in both the BKLBtcJQ inaugural transactions of November 2025 and the BmZY862D62 mass-seeding operations of March 2026.[4]

In cryptographic forensics, the reuse of specific, custom-deployed program accounts across temporally distant attacks acts as a digital fingerprint. It proves that the human operators behind the keyboards are utilizing the exact same proprietary automation scripts, execution logic, and programmatic routing preferences across their entire campaign.[4] The deployment of identical codebases for discrete operations indicates a centralized developer group supplying the wider syndicate, a hallmark of industrialized cybercrime.

Evidence Destruction and Witness Intimidation

The behavior of the SOSANA syndicate rapidly escalated from complex financial fraud to active obstruction of justice and witness intimidation as the independent forensic investigation, led by CRM developer Marcus Aurelius, closed in during late March 2026. The identification and public probing of the network's topology triggered aggressive, sophisticated defensive countermeasures by the operators.

Deletion and Scrubbing of Key Operative Nodes

Following the March 26 extractions, several of the most critical wallets in the enterprise ceased operations. However, rather than simply going dormant—a common tactic for accumulating wallets—these nodes were systematically scrubbed from the active ledger.[4] Most notably, the Tier 4 Feeder wallet, HLnpSz9h2S4hiLQ4uN3vGYAHJqDmbFCwkx9prSXkdPMc, which was the genesis point for the 20 million CRM token distribution, was confirmed deleted from the Solana network.[4]

On the Solana blockchain, the deletion of an account requires the owner possessing the private key to deliberately execute a closure instruction. This action purges the account data from the active state and reclaims the minimal rent-exemption balance (typically 0.00203928 SOL), returning it to the parent wallet.[4] Following this deliberate action, standard remote procedure call (RPC) queries to blockchain explorers return "Account not found" or "Empty" states, effectively erasing the immediate public visibility of the transaction history.[4]

This systematic erasure extended significantly beyond the Feeder node. Queries directed at the confirmed March 26 twin dumper wallets, 6LXutJvK and 7uCYuvPb, as well as the 516,000 CRM heavy dumper HGS4DyyX, all returned identical "EMPTY" statuses.[4] In federal jurisprudence, the deliberate destruction of financial records immediately following the execution of an illicit act establishes an irrefutable "consciousness of guilt." Innocent market

participants do not execute programmatic account purges to obscure their transaction histories; this behavior is the exclusive domain of organized criminals attempting to sever the forensic chain linking their field operatives back to their central treasuries, constituting clear obstruction of justice under 18 U.S.C. § 1519.[4]

The 1-Lamport Dusting as Witness Intimidation

More concerning than the destruction of internal evidence was the enterprise's direct, technological retaliation against the CRM token developer. During the same operational window as the CRM extraction, the developer's verified, legitimate multi-signature operational wallets—8d6f2pSMDsvnrhVz34uQ7EVNYoe7SUL4eWN8avNsjicd and HFTwoBvjLcjo5CTpM42jKKVyETnHGWDUM4CpB4fZVBSc—were actively targeted by the syndicate's infrastructure.[4]

The attack vector manifested as a highly specific "dusting" operation. Malicious nodes (FLipG5QHjZe1H12f6rr5LCnrmqjhwuBTBp78GwzxnwkR and FLipgewPwNeqvwPFW3CvMTLpHTvuX7BQoXC6xhrWiCR3) transferred exactly 1 lamport (0.000000001 SOL, valued at fractions of a cent) into the investigator's accounts.[4] Crucially, these transfers were executed using the exact 18-wallet batch processing script utilized by the AFXigaYu infrastructure during the botnet expansion phase.[4]

In the context of blockchain security, 1-lamport dusting is not a benign occurrence. It serves multiple nefarious purposes. Primarily, it forces the creation of a token account on the target's ledger, generating an immutable, public link between the attacker and the victim.[4] Furthermore, when an investigator inevitably consolidates their funds or moves assets to centralized exchanges for liquidation or security, the malicious dust travels alongside the primary unspent transaction outputs (UTXOs). This allows the syndicate's automated surveillance algorithms to de-anonymize the investigator, track their physical IP interactions via exchange KYC data leaks, and map their broader financial ecosystem.[4]

Given that this dusting utilized the exact programmatic signature of the criminal network actively under investigation, it transcends mere reconnaissance. It constitutes a psychological operation and a direct threat: a digital notification to the investigator that their identities are known, their assets are being surveilled, and the syndicate possesses the infrastructure to reach them.[4] Under US federal statutes, specifically 18 U.S.C. § 1512, this deliberate targeting of an individual exposing a criminal enterprise meets the threshold for witness tampering and intimidation, carrying severe sentencing enhancements and elevating the threat profile significantly.[4]

Real-Time Command and Control: The March 28 Wave 2 Deployment

The threat posed by the SOSANA network did not conclude with the March 26 extraction event or the subsequent evidence deletion. Advanced blockchain surveillance captured live

command-and-control operations deploying a massive, secondary attack layer, designated as "Wave 2," commencing precisely on March 28, 2026.[4]

The operation was initiated by the Senior Treasury, ASTyfSima, which received a rapid, massive replenishment of approximately 138 SOL from three major funding sources (including a 119.88 SOL transfer from HxiFTvdVbiLASvzCtX64thX6N1SDXrA9YZzSC5Y1qshw) at blockchain slot 409382794.[4] Almost immediately following this critical capitalization, the treasury commenced a series of post-operation payroll distributions to the operatives responsible for the March 26 dump.[4]

Forensic tracking isolated a highly significant transaction (Signature: a3rvj...k53) executed at 05:48 UTC, transferring 9.351626 SOL to the wallet BySgEc818hxHMWjNFPjELxpYB2ikGWoHY6zA3PxMNkLC.[4] The timing and magnitude of this transaction strongly implicate the recipient address as the alias for 3TyLzagk, a known Tier 5 operative from the earlier dump.[4] Further fractional SOL distributions (ranging from 0.13 to 1.31 SOL) were simultaneously routed to dozens of other wallets, confirming the existence of a highly structured, tiered operative payroll system.[4]

As the payroll distribution concluded, the enterprise's coordination node, JATcFT2j762i7CAayBhQCGuKVstxgL3gWwQXKWtSPbj4, initiated the Wave 2 deployment at 07:10 UTC.[4] Utilizing the identical 1-lamport batch-dusting methodology previously observed in the 8eVZa7b operations, the JATcFT2j orchestrator processed over 100 transactions within a compressed seven-minute window. This rapid programmatic execution effectively armed and linked 80 to 100 fresh wallets for future extraction events.[4]

A confirmed sample of this active arsenal highlights the scale of the deployment. The following twenty addresses were simultaneously activated and funded in a single coordinated batch on March 28, 2026, representing a massive, immediate threat to market liquidity:

Wave 2 Operative Arsenal (Activated March 28, 2026)

The mobilization of these heavily armed addresses confirms that the syndicate is not dismantling its infrastructure post-extraction, but rather actively reloading and recalibrating for a subsequent, scaled market assault.[4]

Financial Forensics and Total Extraction Calculation

To accurately quantify the systemic impact of the SOSANA enterprise for restitution, asset recovery, and prosecutorial scoping, a comprehensive forensic accounting of all associated tokens and operations is required. The syndicate's strategy relies on extracting micro-fractions of value across thousands of wallets simultaneously, aggregating into massive, centralized treasury reserves.[4]

1. **SHIFT AI Insider Trading and Liquidation (April 2025):** The coordinated offloading of the SHIFT token by the 7GsFEUPC parent wallet and its associated automated bots resulted in an estimated $740,000 in rapidly extracted retail capital.[4]
2. **SOSANA Protocol Perpetual Fee Diversion:** The hardcoded, irrevocable 3% transaction fee applied to the SOSANA token serves as a perpetual revenue engine for the operators. The uncollected tokens in the v1 deployer wallet (9ygyAqzna7) hold an approximate value of $29,061, while the active v2 treasury (F4HGHWya) commands $106,080, totaling $135,141 in ongoing, passive extraction.[4]
3. **CRM Token Immediate Liquidation (March 26, 2026):** The highly synchronized dumping

of 2,496,455 CRM tokens by the Tier 5 operative cluster yielded a directly traceable $11,456 in immediate liquid capital.[4]

4. **Treasury Capitalization and Laundering:** The Senior Treasury wallet ASTyfSima holds a verified 33,413 SOL, representing approximately $4,000,000 in operational liquidity and stored wealth.[4] This massive centralization of wealth heavily implies that the $886,597 explicitly documented across the SHIFT and CRM operations represents merely a fraction of the enterprise's historical yield. Broader intelligence and marketing claims suggest the total syndicate extraction across multiple unnamed tokens may exceed $15 million.[4]

The unrealized threat vector remains substantial and immediate. The syndicate retains active control over 30.52% of the total CRM token supply (exceeding 305 million tokens). Should dormant whale wallets like DLHnb1yt (holding 104.6 million CRM, valued at roughly $19,943 even at severely suppressed prices) or the imminent threat node CyhJT3o8 (holding 12.1 million CRM) execute automated liquidation scripts, the resulting market impact would annihilate the remaining 50% to 80% of the token's market capitalization.[4] This would permanently destroy the residual value held by the legitimate developer and the retail community.

Conclusion and Strategic Recommendations

The exhaustive investigation into the SOSANA and CRM incidents reveals a critical paradigmatic shift in decentralized finance exploitation. The perpetrators have moved definitively beyond simple smart contract vulnerabilities or rapid, single-use "rug pulls" toward the establishment of a continuing, industrialized criminal enterprise.[1] By leveraging 138-wallet-per-second automated deployment scripts, cross-token laundering mechanisms utilizing PBTC, and strict multi-cell compartmentalization (Cell 1 through 4 botnet operations), the operators have constructed a resilient, highly lethal financial extraction engine.[2] The specific operators identified in the records—David Track, Mark Ross, Brian Lyles, Mark Hamlin, and Tracy Silver—are alleged to possess backgrounds involving SEC convictions, federal prison sentences, and massive Ponzi schemes, indicating a deeply ingrained pattern of financial malfeasance.[4]

The forensic evidence compiled herein unequivocally satisfies the stringent requirements of the Racketeer Influenced and Corrupt Organizations (RICO) Act (18 U.S.C. § 1962). The enterprise demonstrates:

- **Association-in-Fact:** Proven through the shared Gp3XVp1V4j smart contract execution environment, identical 1-lamport batch-dusting methodologies across multiple cells, and the unbroken funding loops traversing from the DojAziGhp treasury to the CRM satellite nodes.[4]
- **Pattern of Racketeering:** Established via the continuous 11-month operational timeline, spanning from the April 2025 SHIFT fraud to the March 28, 2026, Wave 2 deployment.[4]
- **Predicate Acts:** Including wire fraud (false representations of community governance), securities and commodities manipulation (synchronized twin-dumping), money

laundering (PBTC token cycling), obstruction of justice (wallet deletion), and witness intimidation (targeted surveillance dusting).[4]

The immediate deployment of the Wave 2 botnet, coordinated by JATcFT2j, indicates that the syndicate is actively prosecuting its next extraction cycle.[4] To mitigate further catastrophic financial losses across the Solana ecosystem and wider DeFi platforms, immediate, coordinated intervention is required.

It is strongly recommended that emergency freeze requests, accompanied by this comprehensive forensic evidence, be dispatched to major centralized exchanges and decentralized aggregators (e.g., Gate.io, MEXC, Raydium) to halt the liquidation of assets associated with the ASTyfSima treasury and the 20 identified Wave 2 operative wallets.[4] Concurrently, the issuance of federal subpoenas targeting the KYC data of the centralized exchange accounts interacting with the Tier 1 profit coordinators will strip the syndicate of its cryptographic anonymity. Translating this immutable blockchain intelligence into actionable federal indictments is the necessary next step to dismantle this industrialized extraction infrastructure and secure restitution for the impacted communities.
