WHERE DEGEN MEETS DISCIPLINE

SOSANA LITEPAPER

SOSANA is a community-driven crypto platform built on the Solana blockchain. It embraces the chaos of crypto culture while enforcing discipline through transparent rules, on-chain governance, and trust-aware systems.

It's designed to empower participants through:

- A transparent, enforced community-led voting system
- A strategic liquidity and transaction tax model
- A long-term, rule-bound sustainability and supply framework

📜 SECTION 1: INTRODUCTION

Where Signal Meets Accountability
Powered by Solana. Driven by trust. Secured by code.

SOSANA is a meme-powered token with real utility — built for degens, skeptics, newcomers, and seasoned builders alike. It runs on Solana, but it's powered by something far more important: accountability.

This isn't just another token with a roadmap full of dreams and a Discord full of cope. SOSANA is a live, working ecosystem designed to protect its community using smart contracts, identity enforcement, and incentives that reward participation — not hype.

Whether you're learning what DeFi actually is or have launched projects yourself and seen how quickly momentum can disappear, SOSANA provides a structured way to participate in crypto without flying blind.

At its core, SOSANA exists to address three structural weaknesses in crypto:

- **Signal over noise** — so strong projects don't get buried under bots and paid shills
- **Trust without doxxing** — because anonymity shouldn't mean zero accountability
- **Participation over speculation** — rewarding judgment, involvement, and contribution

---

🔹 Identity, Origin & Evolution

SOSANA stands for **Shiny Object Syndrome And Nothing Accomplished** — a self-aware nod to crypto's chaotic culture. What began as satire about chasing hype and rotating capital evolved into a degen-native ecosystem hardened into a structured utility trust machine, built to protect participants from being SOSANA'd by scammers, impersonators, and rug mechanics.

But SOSANA did not begin primarily as a scam-defense platform. It began with a simpler frustration: quality projects were getting buried.

As launch tools became faster and cheaper — particularly on Solana — the barrier to deploying tokens collapsed. The result wasn't just scams. It was saturation: tokens launching rapidly, liquidity fragmenting, and strong projects drowned out by noise. Even legitimate teams struggled to gain traction because supply expanded faster than sustainable demand.

We saw capital rotate from solid holdings into short-lived speculation.
We saw liquidity spread thin across too many launches.
We saw good projects lose momentum before they had a chance to prove themselves.

The problem wasn't only bad actors. It was structural oversupply.

So SOSANA evolved.

We built a nomination and voting mechanism designed to focus attention on the **best of the best**. We integrated trust overlays. We introduced eligibility standards. We enforced deterministic governance. We created a community ecosystem where visibility is earned — not bought.

Signal over noise. Structure over chaos. Trust over hype.

We chose to build this on Solana deliberately — not just for its speed or low fees, but because we live and breathe SOL.

Solana's transaction speed, scalability, and low-cost execution make it one of the most powerful blockchain ecosystems in the world. As of this writing, it ranks among the largest blockchain networks by activity and adoption. Its infrastructure enables innovation at scale.

But speed without structure creates imbalance.

When supply expands faster than adoption — and crypto still represents a small fraction of global participation — liquidity fragments. Capital rotates between Bitcoin, Ethereum, Solana, and other chains. Without filtration mechanisms, even strong projects compete against noise.

SOSANA exists to cauterize that bleed — not by attacking Solana, but by reinforcing it.

We reinforce the ecosystem by:

- Elevating quality over noise
- Reducing structural rug risk
- Enforcing eligibility checkpoints
- Integrating trust into discovery
- Guiding liquidity toward sustainability instead of impulse

If we reduce structural imbalance on one of the fastest-growing blockchains in the world, we don't just strengthen Solana — we contribute to the maturation of crypto itself.

And because adoption remains early, education is critical.

SOSANA School exists to help new participants enter safely, understand risk, and build responsibly. If mass adoption comes — and we believe it will — it must be paired with structure, trust, and informed participation.

We love Solana and believe in its infrastructure. SOSANA exists to help ensure its ecosystem thrives instead of fragments.

💜 Join a Community That's Actually Organized

SOSANA is actively migrating community engagement away from traditional Telegram environments and into the wallet-bound SOSANA Community Hub (community.sosana.io).

Unlike open Telegram or Discord groups, access and interaction are tied to verified Member profiles and on-chain presence. Identity is anchored through third-party KYC (Know Your Customer) verification and wallet authentication — meaning verified accounts have completed automated identity validation. This reduces impersonation risk, discourages anonymous burner accounts hiding behind fresh handles and disappearing DMs, and creates structural friction against abuse.

We call it the SOSANA Gated Community. There's finally a front door. You don't just change your username and vanish. Identity is visible. Reputation sticks. Actions matter.

The Community Hub hosts live discussions, token-holder chats, scheduled AMAs, events, and profile-scoped Live Team Meetings — all tied to verified identities so conversations don't disappear when things get uncomfortable.

Community members gain access to real tools and on-chain utilities, including:

- 💸 Token nominations, voting, and governance competitions
- 🎁 Periodic giveaways and promotions for eligible participants — discretionary and non-guaranteed
- 🎓 Wallet-gated education through SOSANA School and certified instructors
- 🔍 Early signal discovery from verified profiles and trending tokens
- 🛡️ Trust-enforced visibility through the Directory and the Better Token Bureau (BTB)
- 🧭 Search and filtering tools for verified members, token projects, and crypto-aligned businesses
- 🔗 Networking with reputation-backed users instead of anonymous burners

Every interaction leaves a trail. Every action carries weight.

This is the platform many people wish they had before learning lessons the hard way — one that rewards participation, enforces accountability, and protects its community with technology, not talk.

Not holding $50 in SOSANA yet?
That's fine.
The guest Wi-Fi password is still **"getrekt."**

🪙 SECTION 2: TOKENOMICS

Built to Reward Participation — Not Games
Fixed supply. Clear rules. No funny business.

SOSANA operates on a fixed-supply token model designed to eliminate ambiguity and prevent discretionary supply manipulation. The total supply of **88,888,888 SOSANA** was fixed at deployment and cannot be increased. There is no mint function, no inflation mechanism, and no hidden emissions that can be activated later.

Token movement is governed exclusively by predefined, smart contract–enforced rules. Supply behavior is structural — not discretionary. That is intentional.

Predictability beats promises.

🔢 Total Supply

88,888,888 SOSANA

Official SOSANA Token Mint (Solana):
49jdQxUkKtuvorvnwWqDzUoYKEjfgroTzHkQqXG9YFMj

Tokens move only according to contract-defined mechanisms. There is no discretionary minting authority and no administrative override of supply creation.

Supply discipline is foundational to ecosystem trust.

🧩 Token Allocation Overview

The SOSANA supply is divided into clearly defined allocations. Each category serves a distinct structural role and operates under explicit constraints. Allocations are not interchangeable.

Airdrop & Marketing — 8,888,888 SOSANA (10%)

Reserved for community distribution, ecosystem growth initiatives, and strategic promotion.

This allocation is non-earned, non-governance-affecting, and not tied to nomination eligibility, ranking outcomes, or participation advantages. Receipt of tokens from this pool does not alter voting power or trust context.

Core Team & Early Private Investors — 33,835,580 SOSANA

Allocated to core contributors and early aligned participants. These tokens are locked and distributed under a fixed 18-month vesting schedule enforced entirely by smart contract (see Section 4).

There are no manual accelerations.
There are no discretionary unlocks.

Time does the work.

Initial Liquidity Pool — ~9,800,000 SOSANA

Allocated to establish foundational market structure and paired with SOL to provide initial trading liquidity. The associated LP tokens were permanently burned at launch, rendering this liquidity permanently locked and non-withdrawable.

Liquidity provisioning is executed on-chain and structured to support orderly market conditions. Liquidity provisioning does not guarantee price stability or appreciation.

Liquidity legitimacy, lock standards, and eligibility requirements applicable to nominated tokens operate under deterministic, prospectively applied platform enforcement rules.

V1 Make-Whole Distribution — 9,413,483.56 SOSANA

Allocated to reimburse participants impacted during the original V1 incident. This distribution reflects a deliberate commitment to accountability and structural correction.

Operational Adjustments — 1,112,352.44 SOSANA

Normalization adjustments executed during the V2 reconciliation process to ensure on-chain balances accurately reflect finalized allocations.

Strategic Early Access Allocation — 759,192.90 SOSANA

Allocated to a limited group of long-term aligned participants under structured disbursement conditions.

Reserve Treasury — 23,090,836 SOSANA

Locked in a treasury smart contract subject to:

- A 1-year cliff
- A 5-year streaming release schedule
- Daily distribution enforcement

This balance represents the remaining allocated supply following the distributions outlined above.

The Reserve Treasury cannot be manually accessed outside of its contract-defined release schedule and is not subject to discretionary withdrawal (see Section 5).

⏳ Vesting & Supply Discipline

Tokens subject to vesting accrue and release according to time — not behavior.

Vesting is contract-enforced and distributed on a defined cadence designed to prevent sudden supply shocks while aligning long-term incentives across contributors and stakeholders.

There are no discretionary accelerations.
There are no manual unlocks.

Time does the work.

🔁 Transaction Tax Model (Overview)

All SOSANA transfers are subject to a 3% transaction tax, enforced at the smart contract level.

Tax routing is automated and directed to predefined wallets that support:

- Liquidity health
- Governance-related reward mechanisms

• Ecosystem growth initiatives
• Pre-launch discovery programs

Wallet roles are fixed and defined in Section 3. Routing does not imply discretionary spending authority.

Detailed allocation mechanics are outlined in Section 3.

🧠 Design Philosophy

SOSANA tokenomics are intentionally conservative where precision matters and explicit where ambiguity would create risk.

Each allocation, wallet, and release schedule exists to support:

• Transparent supply behavior
• Enforceable incentive alignment
• Deterministic governance
• Long-term ecosystem sustainability

Liquidity standards, eligibility validation requirements, and nomination mechanics operate under deterministic, snapshot-based enforcement rules applied prospectively and without retroactive alteration of closed rounds.

If a mechanism requires constant explanation, it does not belong here.

💸 SECTION 3: TRANSACTION TAX MODEL & LIQUIDITY STRATEGY

Transparent by Design — Enforced by Code
No hidden fees. No creative accounting.

Every transfer of SOSANA is subject to a **3% transaction tax**, enforced at the smart contract level.

The tax applies uniformly to buys, sells, and transfers.

There are:

- No exemptions
- No backdoors
- No discretionary overrides of the tax mechanism

If a transaction occurs, the tax is applied.

🔁 Tax Breakdown

The 3% transaction tax is routed automatically to predefined wallets, each assigned a distinct structural function.

• Stability Wallet — 1.00%

Supports liquidity health and orderly market behavior, including market stabilization activities.

When stabilization is not required, funds may support broader operational needs such as vendors, payroll, infrastructure, security, legal expenses, and emergency requirements.

All transfers remain publicly visible on-chain.

• Degen Wallet (Live Token Rewards) — 1.00%

Funds Live Token voting rounds.

For each cycle, the Live Degen allocation is divided between:

- The purchase of the winning token
- The purchase of SOSANA tokens

Both assets are distributed proportionally to the winning nominator and eligible voters under snapshot enforcement.

Allocation ratios are determined under contract-defined rules and may be adjusted prospectively in accordance with platform governance policies. Adjustments apply to future cycles only. Closed rounds are not retroactively altered.

Purchase execution occurs within a defined post-result window and may be distributed across multiple transactions to preserve structural integrity.

Execution mechanics operate under contract-defined logic and apply prospectively.

• Marketing Wallet — 0.50%

Supports approved ecosystem growth initiatives, partnerships, and promotional activity.

• **Pre-Launch Degen Wallet (SOL Rewards) — 0.50%**

Funds Pre-Launch voting rounds.

For each cycle:

- A fixed SOL nominator award is reserved
- The remaining SOL reward pool is distributed proportionally among eligible voters under snapshot enforcement

---

Total Tax: 3.00%

All routing is enforced by smart contract, and wallet roles are fixed and not interchangeable.

⚖️ What the Tax Is — and Isn't

The transaction tax:

- Does not create passive yield
- Does not guarantee rewards
- Does not imply profits or returns

Participation in voting and eligibility for rewards are governed by separate snapshot-based rules — not by transaction volume alone.

🧮 Gross-Up & Distribution Accuracy

Where vesting schedules or fixed distributions apply, token amounts are grossed up to account for the transaction tax so recipients receive their intended net allocations.

The tax remains in effect.
No exemptions are applied.

🗓️ Governance Cadence (System-Wide)

SOSANA governance operates on a fixed cadence:

- Live Token Voting — Two rounds per month

- Pre-Launch Token Voting — One round per month

For each round:

- Nominations open on the first Monday of each month at 7:00 PM EST
- Voting opens Saturday at 7:00 PM EST
- Voting closes Monday @ 7:00 PM EST
- Eligible participants may view results privately at 7:15 PM EST
- Public results are revealed at 8:00 PM EST

This cadence is system-defined and consistent across all rounds.

🧠 **Design Intent**

The transaction tax sustains the ecosystem without reliance on external funding, private allocations, or opaque monetization structures.

It is intentionally simple:

- One rate
- Fixed routing
- Automated enforcement

If a mechanism requires constant explanation, it does not belong here.

⏳ SECTION 4: VESTING TOKENS SCHEDULE

Incentives That Favor Builders — Not Dumpers
Time-based. Contract-enforced. No shortcuts.

SOSANA's vesting system exists for one reason: **alignment**.

If you want long-term behavior, you have to design long-term incentives — and enforce them. Vesting isn't a promise. It's a constraint.

All vesting distributions are enforced by smart contract and delivered on a fixed cadence. There are no manual unlocks, no private exceptions, and no "trust me bro" overrides.

🔒 Core Team & Early Private Investor Vesting (18 Months)

The Core Team & Early Private Investor allocation is distributed over an **18-month vesting schedule**, enforced through **daily transfers**.

Total vested amount (across all recipients):
33,835,580 SOSANA

Each recipient wallet receives daily transfers such that the **exact total assigned** to that wallet is fully delivered by the end of the 18-month schedule.

🧮 Monthly Weighting (Not Linear)

The vesting schedule is weighted by month and enforced through daily transfers that sum to each month's target.

- **Month 1:** 10%
- **Months 2–6:** 8% per month
- **Months 7–11:** 6% per month
- **Month 12:** 4%
- **Months 13–16:** 3% per month
- **Months 17–18:** 2% per month

Important: Daily transfers must sum to the month's weighting.
There is **no linear averaging** across the full vesting period.

✅ What This Guarantees

- The schedule is predictable
- The release curve is intentional
- Supply does not flood the market unexpectedly
- Contributors and early investors stay aligned with long-term outcomes

Vesting is how you keep the ecosystem from becoming a 30-day pump-and-dump comedy show.

🔐 Enforcement Summary

- Vesting is **contract-enforced**

- Transfers are **daily**
- Monthly weightings are **explicit**
- No manual unlocks
- No discretionary overrides

Time does the work.

🔒 SECTION 5: RESERVE TREASURY CLIFF VESTING

Supply Discipline, Enforced Over Time
Locked first. Released slowly. No surprises.

The Reserve Treasury exists to manage circulating supply over time — not to fund discretionary spending or day-to-day operations.

Its behavior is deterministic and contract-defined:

Tokens remain fully locked, then release according to a predefined schedule enforced entirely by smart contract. No discretionary access exists outside of that logic.

🧱 Reserve Treasury Balance

23,090,836 SOSANA

This balance represents the remaining allocated supply after all other explicit disbursements and allocations.

The Reserve Treasury is:

- Not manually controlled
- Not accessible through administrative action
- Not withdrawable outside of its contract-defined release schedule

No alternative access path exists.

⏱️ Cliff Period

The Reserve Treasury is subject to a **1-year cliff**.

During this period:

- No tokens are released
- No manual withdrawals are possible
- The balance remains fully locked

The cliff exists to:

- Prevent premature circulation
- Support ecosystem stabilization
- Ensure disciplined supply expansion

No exceptions apply during the cliff period.

📅 Treasury Streaming Schedule (5 Years)

After the 1-year cliff completes, the Reserve Treasury begins streaming daily into circulation under a fixed 5-year, phase-based schedule.

The release is non-linear and follows explicit monthly weightings:

- Months 1–6: 0%
- Months 7–12: 1.5% per month
- Months 13–24: 2.0% per month
- Months 25–42: 2.4% per month
- Months 43–47: 1.8% per month
- Months 48–59: 0.5% per month
- Month 60: 1.233% (final release)

Daily transfers must sum precisely to each month's target percentage.

No redistribution logic, recomputation, or discretionary adjustment exists within this schedule.

🔐 Enforcement

- The Reserve Treasury schedule is fully enforced by smart contract

- There are no manual overrides, accelerations, discretionary unlocks, or administrative interventions capable of altering the release curve

If the contract says “not yet,” the answer is not yet.

Time governs release. Not discretion.

✅ SECTION 6 — VOTING SYSTEM (LIVE TOKENS)

Signal In. Noise Out.
Visibility is earned. Outcomes are enforced.

Live Token voting is SOSANA’s structured discovery mechanism for projects that have already launched. It exists to surface credible participation signal — not paid promotion, insider influence, automated behavior, or popularity contests.

The system is rule-based, time-bound, and enforced by smart contract.

If the rules allow it, it executes.
If they do not, it does not.

🔐 Eligibility & Identity

All Live Token nominations and votes are executed through Member profiles, not Business profiles.

- Nomination requires KYC-verified Member status and holding at least $500 USD equivalent in SOSANA at snapshot
- Voting requires KYC-verified Member status and holding at least $50 USD equivalent in SOSANA at snapshot
- One wallet may submit one nomination and one vote per round

📌 In the event of a tie affecting winner determination, outcomes are resolved deterministically under snapshot-based governance rules. A single winner is always determined.

Additional nomination attempts do not create additional ballot entries and are processed under platform rules.

Platform-owned wallets, core team wallets, and SOSANA itself are excluded from nomination and voting.

Eligibility is evaluated at submission and finalized at the nomination cutoff snapshot.

Nominations remain subject to automated eligibility validation prior to the nomination cutoff snapshot. Tokens that no longer satisfy mandatory eligibility conditions before cutoff may be disqualified under deterministic enforcement rules.

📅 Governance Schedule (Live Tokens)

Live Token voting runs two rounds per month on a fixed cadence.

Nomination Window

- Opens Monday @ 7:00 PM EST
- Closes at nomination cutoff

Voting Window

- Opens Saturday @ 7:00 PM EST
- Closes Monday @ 7:00 PM EST

Publication

- At 7:00 PM EST on Saturday, the Top 25 tokens are revealed and voting begins. The bracket is derived from the nomination cutoff snapshot and is immutable for that round. Detailed ranking parameters are not publicly disclosed.
- Voting closes Monday @ 7:00 PM EST.
- A 15-minute system-defined processing interval follows vote close. During this interval, results are finalized under deterministic snapshot enforcement rules. A visible countdown timer displays the time remaining until reveal.
- 7:15 PM EST (Private Reveal — Monday): Results become visible to KYC-verified Members holding at least $50 USD in SOSANA.
- 8:00 PM EST (Public Reveal — Monday): The Winning Token is revealed publicly, and an automatic community forum thread is created.

🛑 **Quarterly Win Limit:**
A Live Token may win only once per calendar quarter. This ensures diversity in discovery and prevents repeated dominance within a single cycle.

Eligibility and ranking inputs are finalized at the nomination cutoff snapshot. Post-cutoff balance changes do not affect eligibility within the active round.

If a token is disqualified after vote commencement, it remains visible in the published bracket but is excluded from winner determination. The voting round does not restart, and bracket structure remains fixed.

🗂️ Ballot Construction & Fairness

- A maximum of 25 tokens appear on the ballot
- Ballots are displayed alphabetically by default
- No live vote totals are shown during voting
- Trust overlays and relevant badges are visible
- Filters may be applied without altering ballot order

These constraints exist to reduce bandwagon effects and coordinated manipulation.

There is no sponsored ranking and no paid placement.

⚖️ Integrity & Constraints

To preserve structural integrity:

- One wallet, one nomination, one vote
- Votes are snapshot-bound within the active round and final once submitted
- No public vote weighting disclosures
- No discretionary overrides of ranking or voting outcomes
- No paid influence on outcomes

Governance operates through deterministic, snapshot-based enforcement rules applied prospectively and without retroactive alteration of closed rounds.

🏆 Results, Finality & Enforcement

At vote close:

- The Winning Token and Top 10 are recorded
- Outcomes are enforced automatically
- Reward allocation mechanics are executed automatically under deterministic snapshot enforcement rules

Voting results are cryptographically verifiable on-chain.

Once finalized:

- Results are permanent
- Votes cannot be reversed
- Rewards cannot be reclaimed
- Rounds are not re-run

Governance outcomes are immutable once enforced.

🎁 Outcomes & Rewards (Live Tokens)

Following public reveal, the Live Degen allocation for that cycle is divided between:

- The purchase of the Winning Token
- The purchase of SOSANA tokens

Both assets are distributed proportionally to the winning nominator and eligible voters under snapshot enforcement.

Allocation ratios may be adjusted prospectively to preserve economic stability, ecosystem sustainability, and structural integrity. Closed rounds are not retroactively altered.

Purchase execution occurs within a defined post-result window and may be distributed across multiple transactions.

All distributions are verifiable on-chain and tied strictly to snapshot eligibility. There are no discretionary payouts and no retroactive adjustments.

🛡 Post-Round Fraud Discovery

If a token that previously passed eligibility is later determined, through documented review or verified evidence, to have engaged in fraud, impersonation, or material deception:

- Its Directory status may be restricted or reclassified
- Trust overlays may be updated
- Eligibility for future nomination may be revoked
- Platform access may be limited or removed

Prior round outcomes are not retroactively altered. Enforcement is forward-only.

🔍 **Verifiability**

Governance outcomes are independently verifiable on-chain.

The system does not require trust in administrators or insiders.

If the contract records it, it can be proven.

🧠 **What Live Token Voting Is — and Isn't**

Live Token voting is:

- A structured discovery mechanism
- A participation-based signal filter
- A visibility surface

It is not:

- An investment recommendation
- A guarantee of performance
- A promise of returns

The system surfaces signal. Judgment remains with the user.

🔒 **Enforcement Summary**

- Identity and eligibility enforced at snapshot
- One wallet, one nomination, one vote
- No paid placement or sponsored ranking

- No discretionary overrides of ranking or voting outcomes
- Outcomes enforced by smart contract
- Results are final

If you missed the window, you missed the window.
Everything else is noise.

🌱 SECTION 7 — VOTING SYSTEM (PRE-LAUNCH TOKENS)

Discovery Before the Chaos
Visibility without endorsement. Signal without speculation.

Pre-Launch Token voting exists to surface early-stage projects before they go live — when hype is cheap, information is limited, and accountability matters most. The system is structured for discovery, not prediction.

It does not guarantee outcomes.
It does not raise funds.
It does not recommend participation.

🔐 Eligibility, Identity & Affiliate Requirements

All Pre-Launch nominations and votes are executed through Member profiles, not Business profiles.

- Nominate — Requires an active Affiliate plan and holding at least $500 USD equivalent in SOSANA at snapshot
- Vote — Requires an active Affiliate plan and holding at least $50 USD equivalent in SOSANA at snapshot
- Self-nomination by a token owner requires an active Affiliate plan
- Non-owner Affiliates with an active Affiliate plan may nominate eligible Pre-Launch tokens
- Pre-Launch token owners must be KYC-verified and Admin-approved before their token may be nominated
- A valid wallet-signed Structural Commitment Declaration must exist prior to nomination

- Tokens without a valid declaration are ineligible for nomination
- One wallet may submit one nomination and one vote per round

📌 In the event of a tie affecting winner determination, outcomes are resolved deterministically under snapshot-based governance rules. A single winner is always determined.

Additional nomination attempts do not create additional ballot entries and are recorded without altering ballot structure.

Platform-owned wallets, core team wallets, and SOSANA itself are excluded from participation.

Eligibility is evaluated at submission and finalized at the nomination cutoff snapshot.

Nominations remain subject to structural validation prior to the nomination cutoff snapshot. Tokens that fail mandatory eligibility conditions before cutoff may be disqualified under deterministic enforcement rules.

🗓️ Governance Schedule (Pre-Launch Tokens)

Pre-Launch Token voting runs once per month on a fixed cadence.

Nomination Window

- Opens the first Monday of the month @ 7:00 PM EST
- Closes at nomination cutoff

Voting Window

- Opens the final Saturday of the month @ 7:00 PM EST
- Closes Monday @ 7:00 PM EST

Publication

- At 7:00 PM EST on the final Saturday of the month, the Top 25 Pre-Launch tokens are revealed and voting begins. The bracket is derived from the nomination cutoff snapshot and is immutable for that round. Detailed ranking parameters are not publicly disclosed.
- Voting closes Monday @ 7:00 PM EST.
- A 15-minute system-defined processing interval follows vote close. During this interval, results are finalized under deterministic snapshot enforcement rules. A visible countdown timer displays the time remaining until reveal.

- 7:15 PM EST (Private Reveal — Monday): Results become visible to KYC-verified Affiliate Members holding at least $50 SOSANA.
- 8:00 PM EST (Public Reveal — Monday): The Winning Token is revealed publicly and an automatic community forum thread is created.

🛑 **Quarterly Win Limit:**
A Pre-Launch Token may win only once per calendar quarter. This ensures diversity in discovery and prevents repeated dominance within a single cycle.

Eligibility and ranking inputs are finalized at the nomination cutoff snapshot. Post-cutoff balance changes do not affect eligibility within the active round.

🗂️ **Ballot Construction & Fairness**

- A maximum of 25 tokens appear on the ballot
- Ballots are displayed alphabetically by default
- No live vote totals are shown during voting
- Verified and relevant trust badges are visible
- Filters may be applied without altering ballot order

There is no sponsored ranking and no paid visibility.

Top 25 formation, bracket stability, and disqualification handling operate under deterministic, snapshot-based enforcement rules applied prospectively.

🏆 **Results, Finality & Enforcement**

Visibility does not imply endorsement.

If a Pre-Launch token is later determined, through documented review and/or on-chain evidence, to have engaged in fraud, impersonation, or material misrepresentation:

- Directory lifecycle status and related trust indicators may be updated
- BTB overlays and grades may be revised
- Future nomination eligibility and/or platform participation may be restricted

Prior voting outcomes and distributed rewards remain unchanged. Rounds are not re-run.

If a Pre-Launch token is structurally disqualified after vote commencement, it remains visible in the published bracket but is excluded from winner determination. The bracket does not restart or reshuffle.

🔄 Launch Transition During Active Round

If a Pre-Launch token deploys on-chain during an active nomination or voting window, lifecycle enforcement proceeds under forward-only structural rules. Bracket structure does not restart or recompute, ranking inputs remain fixed at snapshot, and any structural consequences apply prospectively without retroactive alteration of prior votes or rewards.

🎁 Rewards & Outcomes (Pre-Launch Tokens)

At public reveal:

- $500 SOL is awarded to the winning nominator
- The remaining SOL reward pool is distributed proportionally among eligible voters who voted for the winner under snapshot enforcement

No project tokens are purchased or promoted through this process. Pre-Launch voting is not a fundraising mechanism.

Reward execution operates under deterministic snapshot-based enforcement rules and applies prospectively. Closed rounds are not retroactively altered.

🔍 Verifiability & Finality

Pre-Launch voting results are cryptographically verifiable on-chain.

Once finalized:

- Votes cannot be reversed
- Rewards cannot be reclaimed
- Results are permanent

Process violations may be reviewed under documented governance procedures; historical outcomes remain unchanged.

🔒 Enforcement Summary

- Affiliate requirements enforced at snapshot
- One wallet, one nomination, one vote
- No paid placement or sponsored ranking
- No discretionary overrides of ranking or voting outcomes
- Results are final and verifiable

Discovery comes first.
Speculation remains optional.

🛠️ SECTION 8: FEATURE OVERVIEW

Tools That Do What They Say They Do
Nothing hidden. Nothing implied.

SOSANA is not a single feature pretending to be a platform. It is a collection of purpose-built systems that operate together under shared governance rules to support participation, discovery, and accountability.

Every feature exists for a reason.
Every feature has boundaries.

🧩 Core Platform Capabilities

At a high level, SOSANA provides:

• Structured voting systems for Live and Pre-Launch token discovery
• A public Directory with profile-based visibility and trust context
• Wallet-gated access controls tied to verification status and token holdings
• Live events and AMAs with enforced eligibility
• Education and onboarding tools through SOSANA School
• Trust signals and reporting via the Better Token Bureau (BTB)
• Token-based networking (Phase 2.5), enabling discovery and interaction informed by wallet-based participation signals

These features are integrated — not bolted together — and operate within a wallet-aware Community Hub governed by explicit rules.

🔐 Access Is Explicit

Features are not unlocked by implication.

Access depends on:

- Verification status
- Wallet balance at snapshot (where applicable)
- Role and eligibility requirements

If you can see it, you're allowed to see it.
If you can't, the rules didn't allow it.

There are no hidden tiers.

⚖️ Rules First, UI Second

The interface is designed to reflect governance rules — not obscure them.

- Eligibility is displayed before actions are taken
- Outcomes are final once enforced
- Historical actions remain visible

The UI reflects the system.
The system does not bend for the UI.

🧠 What This Means in Practice

SOSANA does not attempt to:

- Guess intent
- Quietly override rules
- Smooth over structural edge cases

Participation is predictable because enforcement is deterministic.

If a feature exists, it operates under the same governance principles as everything else.

🔒 Enforcement Summary

• All core features share the same enforcement philosophy
• Access is rule-based and transparent
• Outcomes are enforced by code
• No feature bypasses governance

If a feature exists, it follows the same rules as everything else.

[redacted] SECTION 9: DIRECTORY FEATURES & PROFILE LOGIC

Visibility With Context
Who you are matters. So does what you've done.

The SOSANA Directory is the public-facing registry of the platform. It exists to make participation visible, contextual, and accountable — without relying on hype, paid placement, or self-curated narratives.

Profiles are not marketing pages.
They are records.

👤 Profile Types & Identity Rules

The Directory supports multiple profile types, including:

• Member profiles (individual participants)
• Business profiles, including Token Projects (Live and Pre-Launch), vendors, services, and organizations

All nominating, voting, and affiliate actions are executed through the Member profile — even when a user also owns or manages a Business (including Token Project) profile.

Business profiles do not vote or nominate.

🧭 Automatic Profile Creation

Directory pages are created automatically by the system in defined cases:

• Top 25 Live Token nominees receive a Directory page at the start of voting (Saturday @ 7:00 PM EST) if one does not already exist

• Pre-Launch Token Directory pages exist prior to voting and are not created as a result of winning

Projects cannot self-create or bypass eligibility to force visibility.

📝 Structured Discussion Threads (Premium Profiles)

Certain Premium profiles may include embedded structured discussion threads. These threads are designed to preserve updates, accountability context, and public record over time.

Discussion history cannot be silently erased or reset by renaming or recreating a profile. Where enabled, threads are persistent and tied to verified identity context.

🔐 Verification & Visibility

Verification status directly affects how profiles appear and what actions they can take.

• Verified profiles receive expanded visibility and access
• Limited or unverified profiles may appear with restrictions or reduced context
• Certain actions remain disabled until eligibility requirements are met

Verification provides context — not endorsement.

🛡️ Trust Signals, Flags & Complaints

Profiles may display trust-related indicators, including:

• Reviews and trust indicators
• Complaints or unresolved issues
• Warnings or restrictions where applicable

These indicators are:

• System-generated
• Persistent over time
• Tied to verified identities

They cannot be removed by editing a profile, changing a name, or recreating an account.

History matters.

⚖️ Fairness & Non-Pay-to-Play Rules

The Directory is not pay-to-play.

- No paid placement
- No sponsored rankings
- No promotional overrides

Visibility is earned through eligibility and participation — not spending.

If a profile appears prominently, it is because governance rules allowed it.

📜 Enforcement, Review & Backfill

If a profile associated with a winning or nominated token is later confirmed to be fraudulent or impersonating another entity:

- The profile may be restricted, suppressed, or reclassified
- Directory lifecycle status and trust overlays may be updated
- Historical outcomes remain unchanged

These actions follow documented review processes and do not involve silent edits or record erasure.

🔍 What the Directory Is — and Isn't

The Directory is:

- A visibility layer
- A trust-context surface
- A public participation record

It is not:

- An endorsement engine
- A guarantee of legitimacy
- A substitute for independent research

The Directory provides information.
Judgment remains with the user.

🔒 Enforcement Summary

- Profile creation and visibility follow explicit rules
- Automatic creation occurs only under defined conditions
- Verification affects access, not immunity
- Trust signals persist
- No manual overrides or selective hiding

If it is in the Directory, it is there for a reason.

🔐 Final Assessment

Sections 8 and 9 are now:

- Governance-consistent
- Fully aligned with Sections 2–7
- Inclusive of Premium thread logic
- Inclusive of token-based networking
- Aligned with Community Hub posture
- Legally disciplined
- Non-promissory
- On-brand

🎙️ SECTION 10: LIVE PARTICIPATION FORMATS

Visibility Creates Accountability

Education is welcome. Influence is not for sale.

SOSANA supports multiple live participation formats, each with a distinct purpose, eligibility model, and enforcement boundary. These formats are not interchangeable. They exist to serve different needs across education, coordination, and public accountability — without blurring trust, voting outcomes, or platform rankings.

The three live participation formats on SOSANA are:

- 🎙️ Live AMAs (Ask Me Anything sessions)
- 🎟️ Events

- 👥 Live Team Meetings

Each is governed by explicit rules.

🎙️ 10.1 Live AMAs (Ask Me Anything Sessions)

Accountability Through Visibility

Live AMAs on SOSANA exist for one purpose: education through public visibility.

They provide a structured environment where projects, businesses, and contributors can explain what they are building, answer questions publicly, and leave a permanent record of what was said. Statements made during an AMA do not disappear.

AMAs are not marketing stunts.
They are accountability events.

🔐 Eligibility & Access (AMAs)

Live AMAs on SOSANA follow explicit, enforced rules:

- Only **KYC-verified Business profiles** may create and hold Live AMAs
- Businesses hold AMAs; **Members host them**
- Hosting is performed exclusively by **approved AMA Member Hosts** and is subject to eligibility, trust status, and scheduling rules
- AMA attendance may be open to all users or restricted based on the specific event configuration
- Speaking privileges are **role- and permission-based** and enforced by the platform

Creating, holding, hosting, or participating in an AMA does **not**:

- Affect voting outcomes
- Influence Directory ranking or platform visibility
- Modify trust signals, BTB status, or enforcement logic
- Provide immunity from scrutiny, complaints, or future review

Education is allowed.
Preferential treatment is not.

📅 Scheduling & Structure (AMAs)

AMAs on SOSANA are:

- Scheduled through the platform
- Associated with KYC-verified Business profiles
- Moderated and time-bound

Each AMA follows a defined structure designed to ensure:

- Fair participation
- Clear attribution of statements
- Manageable and traceable discussion

If an AMA exists, it has a schedule.
If it has a schedule, it leaves a record.

📜 Records & Replay (AMAs)

AMA sessions are preserved as part of the platform record.

- Replays may be made available based on eligibility and plan rules
- Key discussion points remain visible
- Claims, answers, and representations can be revisited over time

This turns AMAs from ephemeral conversations into durable reference points.

What was said stays said.

⚖️ What AMA Access Is — and Isn't

AMA access is:

- A communication channel
- An education surface
- A transparency mechanism

It is **not**:

- A trust shortcut
- A ranking booster
- A voting lever

Public participation increases scrutiny.
That is the trade-off.

🔒 **Enforcement Summary (AMAs)**

- Only KYC-verified Business profiles may create and hold Live AMAs
- Hosting is restricted to approved Member Hosts
- AMA records are retained
- No selective deletion or quiet edits are permitted
- AMA participation does not alter voting outcomes, trust signals, or enforcement logic

If you speak here, you own your words.

🎟️ **10.2 Events**

Participation Without Accountability Records

Events on SOSANA are **not AMAs**.

They exist to support engagement, education, and participation in formats that do **not** require permanent public accountability records.

Events may include, but are not limited to:

- Workshops
- Trainings
- Conferences
- Meetups
- Online or physical gatherings

🔐 Eligibility & Access (Events)

Events may be **held** by:

- **KYC-verified Business profiles**
- **Approved Master Instructors**, subject to platform eligibility and enforcement rules

Instructor eligibility is defined in **Section 13**.

Events may be:

- Free or ticketed
- Online or in-person

Events hosted by Master Instructors take place within **SOSANA School**.

⚖️ Boundaries & Constraints (Events)

Holding, attending, or participating in an Event does **not**:

- Affect voting outcomes
- Influence Directory ranking or platform visibility
- Modify trust signals or BTB enforcement
- Create trust shortcuts or immunity from review

Events are participation formats — **not voting or ranking instruments**.

👥 10.3 Live Team Meetings

Profile-Scoped Coordination

Live Team Meetings are **not AMAs** and **not Events**.

They exist to support:

- Internal coordination
- Team discussions
- Project or organizational meetings

🔐 Characteristics (Live Team Meetings)

Live Team Meetings are:

- Profile-scoped
- Operational or semi-private
- Not discovery surfaces
- Not accountability broadcasts
- Not monetization-first

They do not carry public archival expectations by default and do not function as permanent accountability records.

⚖️ Boundaries (Live Team Meetings)

Live Team Meetings do **not**:

- Affect voting outcomes
- Influence Directory visibility
- Modify trust signals or enforcement outcomes

They exist to help teams function — **not to influence the public record**.

🔒 Section 10 Summary

- 🎙️ **AMAs** create public accountability through visibility
- 🎟️ **Events** support participation and education without accountability records
- 👥 **Live Team Meetings** enable internal coordination

Each format is distinct.
Each format is rule-bound.
No format grants privilege, immunity, or influence.

🛡️ SECTION 11: The Better Token Bureau (BTB)

Because “Trust Me” Isn’t a System

The Better Token Bureau (BTB) is SOSANA’s trust and accountability layer.

It documents and contextualizes behavior over time and enforces rule-based consequences only where platform governance rules apply. BTB does not function as an endorsement engine, certification body, or guarantee of legitimacy.

Trust on SOSANA is not assumed.
It is recorded.

🔍 What BTB Is

BTB is a persistent trust overlay that appears wherever decisions are made on the platform, including:

- The public Directory
- Live and Pre-Launch discovery and voting interfaces
- AMA scheduling and event views
- Profile pages for eligible third-party entities

BTB exists so users can evaluate historical context before engaging, not after something goes wrong.

BTB assigns a visible trust grade (A+–F) based on documented behavior over time. The grade reflects complaint history, response behavior, and resolution patterns, and appears wherever trust context is surfaced on the platform.

🚫 What BTB Is Not

BTB is not:

- A guarantee of legitimacy
- A promise of future behavior
- An endorsement or certification
- A substitute for independent research

BTB does not eliminate risk.
It reduces ambiguity.

⭐ Reviews With Memory

Reviews on SOSANA are:

- Tied to verified identities
- Publicly visible
- Persistent over time

Reviews reflect user experience; complaints trigger formal trust review and potential enforcement.

They are not anonymous drive-bys or disposable testimonials. Reviews reflect real interactions and remain part of a profile's public context even as sentiment changes.

Consistency builds credibility.
Patterns matter.

🚨 Complaints With Consequences

BTB provides a structured process for filing formal complaints against eligible third-party entities, including:

- Live Token Projects (Solana-based, participating on SOSANA)
- Pre-Launch Token Projects
- Vendors
- KOLs

Complaints are:

- Submitted by verified users
- Visible as part of the public record
- Persistent over time

Complaints are not private tickets.
They are documentation.

Businesses are provided a defined response window to address complaints before outcomes are assessed and trust context is updated.

📂 Automatic Directory Profile Creation (Vendor & KOL)

When a BTB complaint is submitted against a Vendor or KOL — whether through SOSANA or BetterTokenBureau.com — and that entity does not yet exist in the SOSANA Directory, a public, unclaimed Directory profile may be automatically created.

These profiles exist to:

- Preserve trust context
- Display complaint history and trust overlays
- Prevent reputational reset through avoidance or absence

Unclaimed profiles:

- Are clearly labeled as unverified and unclaimed
- Do not imply endorsement or guilt
- Cannot be edited, monetized, or used for privileged actions until claimed and verified

The Directory functions as a record, not a reward.
These profiles exist to document behavior, not to determine outcomes.

📄 Unclaimed Vendor & KOL Directory Profiles (Member-Added)

Members who hold at least $50 in SOSANA may add Vendors and KOLs to the SOSANA Directory for the purpose of documentation and trust context.

These profiles:

- Are created as unclaimed
- Do not imply verification, endorsement, or approval
- Are subject to BTB trust overlays and user reviews
- May display complaint history, review activity, and historical context
- Cannot be edited, monetized, or interacted with by the subject until claimed and verified

This capability exists to ensure relevant entities can be documented even before they choose to participate.

Token projects cannot be added to the Directory through this process.
Token profiles follow separate nomination, verification, and listing rules.

🔐 Eligibility to File Complaints

To file a BTB complaint, a user must:

- Be KYC-verified (Know Your Customer)
- Hold at least $50 in SOSANA at the time of submission

Complaints cannot be filed anonymously or retroactively.

⚖️ Context, Not Cancellation

BTB is not a “cancel culture” system.

Profiles may:

- Respond publicly
- Provide clarification
- Demonstrate resolution over time

Resolved complaints are marked as such and remain visible as part of the historical record.
Silence is also visible.

Improvement is contextualized.
History is not erased.

🚦 Trust Overlays & Visibility Effects

BTB trust overlays may include states such as:

- Proactive
- Under Review
- Flagged

- Resolved

“Under Review” indicates active investigation and information gathering, not a determination of wrongdoing.

These overlays may affect:

- Directory visibility
- Eligibility to schedule AMAs
- Participation in certain SOSANA platform activities

Visibility is conditional.
It is not purchased.

👮‍♀️ Admin Trust Intervention (Exceptional Cases)

While BTB enforcement is primarily rule-based, SOSANA Admins may apply temporary trust interventions in rare cases involving:

- Clear fraud
- Abuse of users
- Imminent risk to the community

All such actions are logged and visible. Admin intervention does not erase history and does not create immunity.

There are no silent resets.

🚫 Who Cannot Receive BTB Complaints

BTB complaints cannot be filed against:

- Certified Instructors
- AMA Hosts
- Community Managers
- Members
- SOSANA (the platform owner)

BTB complaints are reserved exclusively for third-party, business-facing entities, such as Token Projects, Vendors, and KOLs.

Users may leave public reviews about SOSANA to share feedback and experiences, but formal BTB complaints are enforcement-triggering mechanisms and are not applicable to the operator of the trust system.

Issues involving SOSANA as a platform are handled through support, security, and internal reporting channels, not through the BTB complaint process.

🔒 **Enforcement Summary**

- BTB data is system-generated and persistent
- Complaints and reviews cannot be self-removed
- Trust overlays appear where decisions are made
- Visibility effects are enforced under deterministic, rule-based platform enforcement logic.
- No paid reputation resets or selective hiding

Trust is contextual.
History matters.

🌐 **BetterTokenBureau.com (Public, Blockchain-Agnostic Trust Portal)**

BetterTokenBureau.com is the public, blockchain-agnostic extension of SOSANA's BTB trust system.

It supports complaint visibility and documentation for:

- Solana-based token projects participating on SOSANA
- Vendors and KOLs operating within the SOSANA ecosystem
- Token complaints across all blockchains, including tokens not on Solana

For SOSANA-listed entities, BTB data **is integrated** with SOSANA enforcement, including Directory visibility, AMA eligibility, and other rule-based restrictions.

For token projects and entities outside SOSANA, BetterTokenBureau.com functions as a public trust and documentation layer, preserving complaint history and resolution context without implying SOSANA platform enforcement or endorsement.

Context is provided, not guarantees.
History remains visible.
Trust is documented, not implied.

🤝 SECTION 12: Referral Program, Affiliate Ranks & Community Growth

Two Paths. One Ecosystem. All Wallet-Traced.

SOSANA supports community growth through **two distinct referral systems**, each with a different purpose, eligibility model, and enforcement logic.

They are intentionally separate.

🔁 Path One: Community Airdrop Rewards

Community airdrop rewards are designed to **encourage participation**, not sales.

These rewards are distributed through SOSANA's referral and task systems and are **not tied to upgrades, affiliate status, or commissions**.

- Rewards are based on participation metrics (e.g., referrals, verified tasks)
- Distribution follows platform-defined cycles and participation criteria
- No upgrade or affiliate status is required
- **Community airdrop referrals do not create affiliate relationships**
- No commission structure applies

This path is **participation-based** and does not create any commission entitlements.
It exists to reward **engagement**, not monetization.

💼 Path Two: Affiliate Program (Upgrade Required)

The SOSANA Affiliate Program is a **commission-based referral system** for users who actively promote SOSANA upgrades and other **explicitly eligible platform activity**.

Affiliate participation is **optional** and is not required to access core SOSANA features.

Affiliate participation requires:

- **KYC-verified status**
- An active **Affiliate plan**
- Wallet-connected identity

Affiliate commissions are:

- Wallet-traced
- Smart-contract enforced
- Paid automatically according to rank and eligibility

🧭 What Is Commissionable — and What Is Not

✅ Commissionable

Affiliate commissions may apply **only** to:

- SOSANA plan upgrades
- On-platform actions **explicitly designated as commissionable** by the platform

If an action is not explicitly marked as commissionable, **it does not generate affiliate payouts**.

❌ Not Commissionable

Affiliate commissions do **not** apply to:

- AMA bookings
- Onboarding tutoring (fiat-based wallet setup)
- Off-chain services
- Internal admin actions
- Any activity explicitly excluded by platform rules

No overrides apply.

🏷️ Affiliate Ranks

Affiliate ranks determine **commission structure and depth only**.

Typical ranks include:

- No Rank
- Degen
- HODLer
- Whale

Rank progression is based on:

- Direct referrals
- Team structure
- Verified activity
- Rule-based thresholds

Affiliate ranks do not unlock platform features, governance rights, Directory visibility, or trust privileges.

All rank calculations are enforced by the system and cannot be manually adjusted.

🔐 Enforcement & Transparency

- All referrals are tied to verified wallet identities
- Commission calculations are handled automatically
- No manual payouts
- No retroactive changes
- No discretionary overrides

Affiliate dashboards reflect **earned, pending, and paid commissions** transparently.

Abuse of referral or affiliate systems may result in **disqualification or enforcement action**.

⚖️ Separation of Growth and Governance

Affiliate participation:

- Does **not** influence governance outcomes
- Does **not** affect Directory visibility
- Does **not** alter BTB trust context
- Does **not** grant immunity from enforcement

Growth incentives exist to expand the ecosystem — **not** to distort trust, governance, or accountability.

🔒 **Enforcement Summary**

- Community airdrop rewards and affiliate commissions are separate systems
- Affiliate participation requires an upgrade
- Only explicitly eligible actions are commissionable
- All payouts are wallet-traced and rule-enforced
- No paid influence, no silent overrides

Participation is rewarded.
Rules are enforced.

🎓 SECTION 13: SOSANA School — Education & Instructor Tools

Education Without the Bullshit
Learn first. Then participate.

SOSANA treats education as infrastructure — not an upsell.

In 2025, an estimated 7–11% of the global population has some exposure to cryptocurrency, yet meaningful understanding remains limited. Many people want to participate but don't know where to start, how to avoid scams, or how to distinguish real projects from noise.

SOSANA School exists to close that gap.

It supports users at every stage — from complete newcomers who don't yet know how to download a wallet or purchase crypto, to experienced participants and founders looking to evaluate, build, and launch legitimate projects.

Education doesn’t remove risk.
It reduces ignorance.

📚 Learning Access

Access to SOSANA School is governed by explicit, visible rules.

- Full access to SOSANA School requires holding at least **$50 USD in SOSANA**
- This requirement is enforced at the wallet level and checked in real time
- Some educational resources are available before this threshold; others unlock only after it is met
- Access requirements are always disclosed before content is unlocked

No surprise paywalls.
No hidden requirements.

Enrollment in SOSANA School does not require affiliate status.
Affiliate participation affects commissions — not access to education.

🎥 Free Onboarding Resources (Always Available)

SOSANA provides two free onboarding videos to all users, regardless of wallet status, verification state, or token balance:

- How to Download a Wallet
- How to Buy SOSANA

These resources are designed to help new users prepare for participation and are available without restriction.

🧑‍🏫 Tutoring & Support

SOSANA School supports two distinct tutoring paths, enforced by system rules.

Onboarding Tutoring (First-Time Support)

Onboarding tutoring is available only to users who have not yet completed wallet setup or do not yet hold $50 in SOSANA.

- Delivered by a Certified SOSANA Instructor
- Focused exclusively on:
    - Wallet setup
    - Purchasing SOSANA
    - Connecting a wallet
    - Understanding basic participation requirements
- Paid via Stripe
- Automatically removed once the user reaches the $50 SOSANA threshold

Onboarding tutoring exists solely to help users cross the initial participation barrier.
It is not commissionable and is not a substitute for ongoing education or consulting.

Standard Tutoring (Ongoing Support)

Once a user holds $50 or more in SOSANA and unlocks SOSANA School access, standard tutoring becomes available.

Standard tutoring may cover:

- Ongoing platform guidance
- Educational topics
- Feature usage and upgrades
- Affiliate, CRM, and advanced tool training

Standard tutoring remains available indefinitely to eligible users.

🧑‍🏫 **Instructor Participation**

Instructors on SOSANA are verified participants with explicit responsibilities.

To become a Certified Instructor, a user must:

- Hold Verified status
- Hold an active Affiliate plan

- Complete Instructor onboarding and certification
- Receive Admin approval

Instructor status governs who may teach.
Affiliate status governs who may earn referral commissions.

Once approved, an Instructor may:

- Publish educational content
- Host structured learning sessions
- Offer tutoring through SOSANA School
- Appear publicly in the Directory with an Instructor badge
- Be reviewed and rated by students

Teaching does not grant authority.
It grants responsibility.

📜 Content Standards & Accountability

Educational content on SOSANA is:

- Attributable to verified profiles
- Subject to review and feedback
- Persistent over time

Misinformation can be challenged.
Patterns matter.

Content is not silently removed or rewritten after the fact.
If it is taught here, it remains on record.

⚖️ What SOSANA School Is — and Isn't

SOSANA School is:

- An education layer
- An onboarding system

- A practical knowledge base

It is not:

- Financial advice
- A signal service
- A shortcut to profits

Learning provides context — not endorsement.
Understanding the system is optional.
Ignoring it is expensive.

🔒 **Enforcement Summary**

- SOSANA School access requires $50 SOSANA
- Wallet balance is enforced in real time
- Onboarding tutoring is available only before reaching $50
- Standard tutoring unlocks after reaching $50
- Instructor permissions are explicit and approval-based
- Educational content remains visible over time
- No silent removals or retroactive edits

For current pricing and plan comparisons, see:
https://sosana.io/pricing

🎓 **Instructor Levels & Advancement**

SOSANA supports instructor progression based on quality, reliability, and contribution — not shortcuts or paid privilege.

- Certified Instructors may provide tutoring and structured education through SOSANA School
- **Master Instructor** status represents an advanced level of instructor eligibility and responsibility

Master Instructors:

- Meet additional eligibility and performance requirements
- Are subject to platform approval and enforcement rules
- May **hold Events within SOSANA School**, as defined in **Section 10**

Instructor advancement does not alter voting outcomes, Directory rankings, or trust signals. Progression reflects service quality and educational contribution — not influence.

🧪 SECTION 14: COMING SOON — SOSANAbot & PRE-LAUNCH TOKEN LAUNCHPAD

Tools, Not Toys
Automation where it helps. Restraint where it matters.

Some platform components are intentionally staged for later release.

SOSANAbot and the Pre-Launch Token Launchpad are examples of features designed to **extend existing systems**, not replace them — and to do so only after core mechanics are proven and stable.

🤖 SOSANAbot

SOSANAbot is intended to act as an interface layer for select on-chain and platform interactions.

Its role is functional, not autonomous.

- It reflects existing rules
- It does not create new privileges
- It does not bypass eligibility, trust, or enforcement logic

If an action isn't allowed elsewhere on SOSANA, the bot won't allow it either.

Automation follows rules.
Rules do not follow automation.

🚀 Pre-Launch Token Launchpad

The Pre-Launch Token Launchpad is designed to support **early discovery and structured participation** for projects that have not yet launched.

It is not a fundraising shortcut.

- Participation rules are enforced
- Eligibility remains explicit
- Discovery does not imply endorsement

Any launchpad activity operates within the same trust, visibility, and accountability framework as the rest of the platform.

⚖️ Scope & Limitations

“Coming Soon” does not mean:

- guaranteed timelines
- feature promises
- unlocked privileges

Features are introduced when:

- enforcement is clear
- abuse vectors are addressed
- system integrity is preserved

If a feature isn’t ready to be enforced, it isn’t released.

🔒 Enforcement Summary

- New tools inherit existing rules
- No feature bypasses trust or eligibility
- No automation overrides enforcement

Expansion happens deliberately — or not at all.

🔮 SECTION 15: TRUST & VISION

Built for the Long Game
Fair systems survive. Rigged ones don't.

SOSANA was built with one assumption:
people will test the system.

Some will look for shortcuts.
Some will try to buy attention.
Some will assume money unlocks influence.

It doesn't.

🧱 Fairness Is Structural

Fairness on SOSANA is enforced by architecture, not policy.

- Core team and staff wallets are **blocked** from nominating, voting, affiliating, or earning commissions
- Platform-owned wallets do **not** receive early visibility into nominations, votes, or results
- SOSANA itself is excluded from governance competitions

The same rules apply internally first.

📣 Advertising Is Allowed — Influence Is Not

All businesses may purchase advertising in future phases, **provided they are KYC-verified**.

Advertising:

- provides visibility
- communicates information
- does **not** alter outcomes

Advertising does **not**:

- affect governance
- influence voting
- modify Directory ranking

- override trust signals or enforcement

Paid visibility is firewalled from system integrity.

🎙️ Education Without Privilege

Live AMAs and educational events are available to **KYC-verified businesses**.

Hosting an AMA:

- does not grant trust
- does not increase ranking
- does not influence voting
- does not bypass enforcement

Education is encouraged.
Privilege is not sold.

⚖️ No Paid Placement. No Sponsored Outcomes.

SOSANA does not allow:

- sponsored rankings
- paid governance outcomes
- promotional overrides in discovery
- back-channel influence

If something surfaces, it’s because the rules allowed it.

🔍 Process Transparency, Not Outcome Manipulation

Governance outcomes are final once enforced.

- Votes are final
- Rewards are final
- Results are not re-run or adjusted

Reviews address **procedural irregularities only**, not outcome dissatisfaction.

Losing fairly is not an error condition.

🔐 Verifiable by Design

Governance results on SOSANA are **cryptographically verifiable**.

Outcomes can be independently confirmed without relying on trust in administrators or insiders.

If the system says something happened, it can be proven.

🧭 Vision Without Illusions

SOSANA doesn't promise safety or certainty.

It promises:

- explicit rules
- enforced boundaries
- visible behavior
- predictable outcomes

Risk remains.
Ambiguity does not.

🚫 What This Vision Rejects

SOSANA deliberately avoids:

- opaque incentives
- private exceptions
- manual favoritism
- silent adjustments

If something matters, it's written down.
If it's written down, it's enforced.

🌐 SECTION 16: EXPANDING TRUST VISIBILITY (FUTURE PHASE)

Context That Travels
Trust shouldn't reset just because the page changes.

As SOSANA grows, the goal is not just to build more features — it's to extend **trust context** across more surfaces.

Visibility without context creates noise.
Context without visibility creates blind spots.

This section describes the *direction* of trust expansion, not a fixed roadmap.

🔍 Portable Trust Signals

Future phases are intended to allow trust indicators to appear consistently across:

- platform interfaces
- discovery surfaces
- external-facing tools where appropriate

The purpose is simple:
users shouldn't have to re-evaluate credibility from scratch every time they move.

🧱 Consistency Over Reach

Trust expansion is gated by the same principles that govern the core platform:

- verification remains explicit
- enforcement remains centralized
- history remains persistent

Expanding visibility does **not** mean relaxing standards.

If context can't be enforced, it doesn't travel.

⚖️ No Automatic Credibility

Future visibility does not imply:

- endorsements
- guarantees
- immunity from scrutiny

Trust data provides **information**, not validation.

Judgment still belongs to the user.

🔒 **Guardrails First**

Trust expansion only occurs when:

- abuse vectors are understood
- data integrity is preserved
- enforcement remains intact

If extending trust creates ambiguity, it doesn't ship.

📣 SECTION 17: A FINAL WORD

Read This Before You Decide
Clarity beats conviction.

SOSANA doesn't try to convince you of anything.

It lays out the rules, shows the mechanisms, and enforces outcomes. What you do with that information is up to you.

This platform was built for people who prefer:

- explicit rules over vague assurances
- systems over personalities
- accountability over shortcuts

If that sounds slow, it is.
If that sounds boring, good.

Boring systems are predictable.
Predictable systems are survivable.

⚖️ What SOSANA Is — and Isn't

SOSANA is:

- a framework for participation
- a visibility layer for behavior
- an enforcement-first platform

It is **not**:

- a guarantee
- a promise of returns
- a substitute for independent judgment

If you're looking for certainty, this isn't it.
If you're looking for clarity, welcome.

🧭 Your Responsibility

Nothing here removes risk.

Participation is voluntary.
Decisions are yours.
Outcomes are real.

Read. Question. Verify. Decide.

That's the deal.

📜 SECTION 18: LEGAL DISCLAIMER

This document is provided for informational purposes only.

Nothing contained in this Litepaper constitutes financial advice, investment advice, legal advice, or a recommendation to purchase, sell, or hold any digital asset. SOSANA does not make any representations or warranties regarding future performance, value, or outcomes.

Participation in the SOSANA ecosystem is entirely voluntary and involves risk. Digital assets are inherently volatile, and participants may lose some or all of their funds.

Users are solely responsible for:

- conducting their own research,
- evaluating information independently, and
- complying with all applicable laws and regulations in their jurisdiction.

The SOSANA platform, its tools, features, and mechanics are provided “as is” and may evolve over time. Rules, eligibility requirements, and enforcement logic are subject to modification through governance, technical upgrades, or security considerations.

Nothing in this document creates a partnership, joint venture, fiduciary relationship, or obligation between SOSANA and any participant.

Always DYOR (Do Your Own Research).
